

9 Appendix 1. Glossary

| | |
|--------------------------------|--|
| AGE CATEGORY | <p>The age of the tree is represented as Juvenile, Semi-mature, Mature or Senescent.</p> <hr/> <p>Juvenile: A young tree, given normal environmental conditions for that tree it will not yet flower or fruit.</p> <hr/> <p>Semi-mature: Able to reproduce but not yet nearly the size of a mature specimen in that location.</p> <hr/> <p>Mature: Has reached or nearly reached full size and spread for that species in the given location.</p> <hr/> <p>Senescent: Has passed maturity, tree health in a state of decline.</p> |
| AMENITY VALUE | <p>A judgment of amenity and/or utility the tree provides based on Species, size, Age, Health and local environment. Amenity may be based on ecological or landscape value or both.</p> <p>Documented as Low, Medium or High.</p> <p>Amenity value does not consider the degree of risk associated with a tree, a weedy species will not be rated as High for Amenity value.</p> |
| ARBORICULTURAL RETENTION VALUE | <p>A rating assigned to a tree or group of trees related to the value of retaining those trees in situ. The judgement is based on Tree condition (Health, Structure & Form), Useful Life Expectancy (ULE), Origin and Age.</p> <p>Age is a primary consideration as it is the determining factor when considering how long it would take to replace the amenity lost when trees are removed.</p> <hr/> <p>Very High</p> <ul style="list-style-type: none"> • Mature tree in good condition, long lived species with Very High Amenity value • Semi-mature or mature rare species in fair to good condition <hr/> <p>High</p> <ul style="list-style-type: none"> • Semi-mature to Mature tree in good condition, long lived species with a high Amenity rating • Juvenile rare species • Trees of moderate condition that offer exceptional amenity due to factors such as species, size or ecological value <hr/> <p>Medium</p> <p>All trees that don't fit in the alternative categories and are assessed to have fair/poor or lower rating for either health of structure.</p> <hr/> <p>Low</p> <ul style="list-style-type: none"> • Juvenile trees (not including rare species) • weeds that offer Medium or high amenity value <hr/> <p>Nil</p> <p>Contribution in the landscape is of no value or detrimental – usually associated with small dead or dangerous trees or environmental weeds</p> |
| CAMBIUM LAYER | <p>A layer of cells between the bark and wood tissue that divide to form new cells. Usually a slimy green layer just under the bark.</p> |
| CANOPY SPREAD | <p>Overall size of the canopy as looking from a plan view. Recorded at the widest point.</p> |
| CO-DOMINANT STEMS | <p>Two stems of approximately the same thickness and height originating from the same position in the tree.</p> |

| | |
|------------------------------------|---|
| DBH (Diameter at Breast Height) | The diameter of the trunk measured at or near 1.4m above ground level. Where there is more than 1 stem originating below 1.4m the measurement recorded is calculated as described in AS 4970-2009 |
| DEAD (AS DEAD) | Cessation of all metabolic processes (or very soon to be) |
| DE-OXYGENATION | A lack of oxygen, normally referring to the state of the soil |
| EPICORMIC SHOOTS | Re-growth from the trunk or branches, originating from dormant buds under the bark, usually poorly attached, often an indicator of tree stress. |
| FORM | Reference to the symmetry of the crown as observed from all angles and in accordance with the morphology of that species, and documented as Poor, Fair or Good. |
| HAZARD | Anything that has the potential to cause injury or damage |
| HEALTH | A trees vigour as exhibited by the crown density, leaf colour, seasonal extension growth, presence of stress indicators, ability to withstand diseases and pests, and the degree of dieback. |
| | Dead: Cessation or near cessation of all metabolic processes |
| | Poor: Indicating symptoms of extreme stress such as minimal foliage, or extensively damaged leaves from pests and diseases. Death probable if condition of tree deteriorates. |
| | Fair: Not nearly of 'Good' condition (see below) |
| | Good: Usual for that species given normal environmental conditions – full canopy with only minor deadwood, normal leaf size and extension growth, minimal pest or disease damage |
| | Excellent: Better than usual for that species under normal conditions |
| HEIGHT | The distance in metres from the ground to the highest point in the crown, calculated in the vertical plane. This measurement unless otherwise specified is an estimation only. |
| INCLUDED BARK UNION | A union within a tree that has included bark (bark pressing on bark), these unions are usually poorly attached and more likely to fail as the included bark is equivalent to a split. Often characterized by an acute angle and sometimes forming ribs or flaring immediately below the union where the tree reacts to the weakness by placing secondary growth. Though these unions are weaker than a 'good' union, the risk of failure cannot be calculated. |
| LOPPING / TOPPING | The removal of parts of a tree giving no consideration to the trees natural defence systems. |
| ORIGIN/TYPE | Origins of the species related to its setting – <u>Indigenous</u> is native to that location, <u>Non-indigenous Native</u> is Australian but not local, <u>Exotic</u> is not from Australia. Sometimes a classification of <u>Weed</u> will be assigned; this indicates that the species is generally unwanted within this geographic area (regardless of origin) |
| PATHOGEN | Disease causing agent |
| PRUNING | Systematic removal of branches of a plant whilst giving consideration to the trees natural defence systems. |
| RETENTION VALUE | See 'Arboricultural retention value' |
| RISK | The chance and degree of injury or loss presented by a hazard |

| | |
|----------------------------|---|
| STRUCTURE | <p>Reference to the structural integrity of the tree with consideration of the crown, trunk and roots. Determined using the Visual Tree Assessment (VTA) method (Mattheck and Breloer 1994) . The failure of small (<60mm calliper) live or dead limbs is normal and not considered here.</p> <hr/> <p>Very poor: Clear indications that a significant failure is likely in the near future</p> <hr/> <p>Poor: Signs of structural weakness obvious and failure likely, one might expect a significant failure event within the next 5 years, possibly tomorrow</p> <hr/> <p>Fair: Signs of weakness present though not obviously significant, likely to become worse over time</p> <hr/> <p>Good: No obvious signs of structural weakness</p> |
| TREE NUMBER | Identifying number allocated to individual trees or groups of trees, may be used to locate trees using site plans or tags on trees. |
| TREE PROTECTION ZONE (TPZ) | <p>An exclusion area that allows for protection of canopy and roots; both the structural roots that give the tree stability and the smaller absorption roots. The radius of the TPZ is normally calculated for each tree by multiplying the DBH × 12. The minimum distance will be 2m and maximum 15 as stipulated in the Australian Standard 4970-2009 – Protection of trees on development sites.</p> <p>For River Red Gums within Whittlesea City Council boundaries, the City of Whittlesea Tree Protection Zone calculation method must be applied</p> |
| TREETEC REFERENCE | Unique identifier assigned to an individual report by Treetec |
| ULE | <p>Useful Life Expectancy is an estimation of how many years a tree can be retained in the landscape provided growing conditions do not worsen and any recommended works are completed.</p> <p>It takes into consideration factors such as species, age, health, defects / hazards and site conditions.</p> |

10 Appendix 2. General Comments

10.1 Hazards and Risk

Large old trees present hazards, in particular from falling limbs, this should be considered and managed in accordance with the City of Whittlesea scattered tree retention policy.

Risk assessment of trees relies on an appraisal of the structural integrity of a tree in conjunction with the likelihood of tree failure (either whole tree or limbs) adversely impacting people or property.

Risk for the assessed trees, included in this report, at the time of inspection was considered to be low; however, once development is introduced, the risk will increase as targets and occupancy under or around trees increases.

Once development is complete and TPZ measures (fencing) are removed, all retained trees should be assessed for hazards and risk; any tree related hazards should be addressed prior to use of the area.

10.2 Controlling risk

Risk mitigation measures may include:

- Pruning to remove weak or damaged components of a tree.
- Locating of targets such as seating, paths or playgrounds away from under or near trees.
- Fencing areas to exclude people from under trees - conservation reserves around trees which limit access.
- Appropriate signage.
- Improving growing conditions by providing adequate space between development and trees.

Though branch shedding and tree failure cannot be eliminated, by implementing regular hazard inspections as well as risk assessment and control, failure events and therefore risk, will be significantly reduced.

Treetec have been advised of the City of Whittlesea's adopted management practices in regards to tree risk. These practices are conducted in accordance with AS4373 – 2007 and under supervision of a qualified arborist, and have been successfully implemented within a number of residential estates throughout the municipality.

10.3 Tree age

The size of a tree has a strong influence on its retention value. Typically, the larger a tree the higher the retention value. Age is important in determining how long it would take to replace the amenity that a specific tree provides. Hence it would be unusual for a juvenile tree to attract a high or very high ARV rating.

10.4 Maintaining Tree Protection Zones (TPZ)

Where it is determined that a TPZ is to be established, the area should be fenced prior to commencement of nearby demolition / construction work, this TPZ exclusion area must be protected; no materials, equipment, waste, chemicals or vehicles are to be stored or parked within this area. The soil profile and level within the TPZ should not be disturbed or altered.

If at any time, the TPZ may need to be infringed upon for works such as, excavation for the installation of pipes or drainage, or the movement of equipment, or any other interference that may cause a change in the availability of water or oxygen to the tree, a suitably qualified Arborist should be consulted to direct and supervise the works.

It may be possible to work within a TPZ without significantly impacting a tree, however, the size and number of roots in the area would need to be determined prior to commencement, and design and construction methods must be tree sensitive.

10.5 Soil compaction

Soil compaction reduces the number and size of soil pores, subsequently reducing the available water and oxygen to a tree, this then impedes a tree's ability to respire (consume reserved energy supplies) and increases stress. Subsequent symptoms may include thinning or dying crown, reduced or no seasonal extension growth, limb shed or death of the tree. Insect infestation may increase as a tree's natural ability to withstand pests is diminished.

10.6 Physical / mechanical damage to trees

Physical damage to tree parts, particularly the trunk, is unsightly and provides entry points for pests and diseases such as fungal infections. This may cause long-term decay and can lead to partial or complete tree failure and death.

10.7 Alteration of soil levels

Alteration of soil levels around trees will affect the root zone and stability of a tree as well as tree metabolism. This may result in reduced tree health, excessive deadwood, thinning foliage and poor vigour; it can take some years for the impact to become evident at which time it is normally irreversible.

10.8 Pruning standards / Lopping

An Australian standard exists to give guidance on the pruning of trees, the objective of the standard is to provide arborists, tree workers, government departments, and contractors with a guide defining uniform tree pruning procedures and practices in order to minimise the adverse or negative impact of pruning on trees. It is important that all tree works are carried out by a competent contractor in accordance with the Australian Standard. (AS. 4373 2007 - Pruning of Amenity Trees).

Lopping as defined within the standard, is detrimental to trees and often results in decay and poorly attached epicormic shoots. Natural target pruning methods, as per AS 4373 2007 should be used wherever possible when removing sections from trees.

11 Appendix 3. Tree Data

51 Very High ARV trees

328 High ARV trees

7 Medium ARV trees (indicative samples only)

| TREE # | SPECIES | TYPE | DBH (CM) | HEIGHT (M) | SPREAD (M) | AGE CATEGORY | HEALTH | STRUCTURE | TPZ | ULE (YRS) | RETENTION VALUE | NOTES | LATITUDE | LONGITUDE | DELWP ID |
