1 Introduction

Cardno was retained by Metropolitan Planning Authority to undertake analysis of 41 intersections within the Thompsons Road, Clyde Creek and Casey Fields South PSP areas, to inform future intersection design and costing analysis for the purposes of a Developer Contributions Plan.

The three PSP areas, and the intersections analysed, are shown in Figure 1-1

Figure 1-1 Thompsons Road, Clyde Creek and Casey Fields South PSP area

2 Traffic Volumes

2.1 Sub-Regional Modelling

Sub-regional scale transport modelling was undertaken in 2012, based on the road network included in the Growth Corridor Plans. More detailed planning for the Precincts has identified the need to modify the road network and update land uses.

As a consequence, the strategic transport modelling of the Precincts was updated by AECOM, with the results provided for review and ultimately input into the SIDRA analysis.

The results include the Ultimate (2046) and Interim (2026) scenarios.

2.2 Modelling Review

A sensibility review of the modelling outputs was undertaken by Cardno. The review considered:

- > Likely generation and distribution of traffic from residential, commercial and school precincts;
- > Sensibility of turning movements and routes taken;
- > Comparison of through traffic volumes to road cross-section;

As a result of the modelling review, several modifications to the modelled traffic volumes were recommended, as detailed in Table 2-1.

Table 2-1 Traffic Volume Modifications

| Intersection | Intersection Leg - Movement | Volume Change |
|---------------|-----------------------------|---------------|
| IN-53-01 (PM) | West/East - Through | - 250 |
| IN-53-04 (AM) | South - Through | + 100 |
| IN-53-04 (PM) | West/East - Through | - 250 |
| | North - Through | - 150 |
| | North - Left | - 100 |
| | South - Through | + 100 |
| | South - Right | - 250 |
| IN-53-05 (AM) | South - Right | - 100 |
| IN-53-05 (PM) | West - Through | - 100 |
| | South - Right | - 100 |
| IN-53-06 (PM) | West - Right | - 100 |
| IN-53-08 (AM) | South - Through | + 100 |
| IN-53-08 (PM) | South/North - Through | + 100 |
| IN-53-11 (AM) | South - Through | + 100 |
| IN-53-11 (PM) | South/North - Through | + 100 |
| | North - Right | - 225 |
| IN-53-17 (AM) | South - Right | - 100 |
| | South – Through | + 100 |
| IN-53-17 (PM) | East - Left | - 100 |
| | South - Right | - 100 |

| Intersection | Intersection Leg - Movement | Volume Change |
|------------------|--|---------------|
| | South/North - Through | + 100 |
| IN-54-01 (AM) | East - Right | - 100 |
| | East – Through | + 100 |
| IN-54-01 (PM) | East – Right | - 100 |
| | East – Through | + 100 |
| IN-54-04 (PM) | West - Left | - 100 |
| IN-54-09 (AM) | North - Left | + 135 |
| IN-54-09 (PM) | East - Right | + 90 |
| IN-54-13 (AM/PM) | Adopted same volumes as IN-54-14 for all movements | |
| IN-54-17 (AM) | North - Left | + 100 |
| | East - Right | + 100 |
| IN-54-17 (PM) | North - Left | + 100 |
| | East - Right | + 100 |
| IN-54-20 (AM) | West - Right | + 50 |
| | South - Left | + 80 |
| IN-54-20 (PM) | West - Right | + 80 |
| | South - Left | + 50 |
| IN-57.1-04 (AM) | South - Left | + 50 |
| | West - Right | + 50 |
| IN-57.1-04 (PM) | South - Left | + 50 |
| | West - Right | + 50 |

As a result of high turning movement volumes to the majority of intersections there were a high number of modifications to turning lanes from the standard intersections. A summary of the turning lane modifications is provided in Table 2-2.

Table 2-2 Turning Lane Modifications

| Intersection | Intersection Leg – Turning Lane | Lane Length |
|--------------|---------------------------------|-------------|
| IN-53-01 | North - Right (double) | 100m/85m |
| | East - Left | 100m |
| | South - Right (double) | 125m/115m |
| IN-53-02 | North - Right | 85m |
| IN-53-04 | North - Right (double) | 100m/85m |
| | South - Right (double) | 100m/85m |
| | West - Right (double) | 100m/85m |
| IN-53-05 | North - Right | 85m |
| | East - Right | 115m |
| | South - Right | 85m |
| IN-53-06 | South - Right | 60m |
| | West - Right | 150m |
| IN-53-09 | East - Right | 60m |
| IN-53-11 | North - Right (double) | 125m/100m |
| | East - Right | 100m |

| Intersection | Intersection Leg – Turning Lane | Lane Length |
|--------------|--|-------------|
| | West - Left (through movement adjusted to provide double signalised left turn slip lane) | 80m |
| IN-53-14 | North - Right | 60m |
| IN-53-15 | West - Right | 85m |
| IN-53-16 | West - Right | 60m |
| IN-53-17 | North - Right (second lane removed) | 85m/0m |
| | East - Left (included a left turn slip lane) | 60m |
| | South - Right | 200m |
| | West - Right | 150m |
| IN-54-01 | East - Right | 100m |
| | South - Right | 120m |
| IN-54-03 | East - Right | 120m |
| | South - Right | 150m |
| IN-54-04 | North - Right (double) | 100m/85m |
| IN-54-05 | South - Right | 60m |
| IN-54-06 | North - Right (double) | 60m/45m |
| | South - Left | 60m |
| IN-54-07 | North - Right | 80m |
| IN-54-12 | East - Right | 80m |
| IN-54-13 | South - Left | 100m |
| | West - Right | 80m |
| IN-54-14 | West - Right | 80m |
| IN-54-18 | East - Right | 80m |
| IN-54-19 | South - Right | 45m |
| | West - Right | 80m |

2.3 Final Traffic Volumes

Following the modelling review, and subsequent liaison and discussion with stakeholders, an approved set of turning movement volumes was adopted for each intersection subject to analysis.

The approved traffic volumes are indicated within the SIDRA analysis results presented in the subsequent analysis.

3 SIDRA Analysis Assumptions and Details

The following assumptions and analysis details have been applied to each intersection, unless otherwise noted in the analysis. Where no commentary is provided, SIDRA defaults are retained.

1. SIDRA Version 5.1.6.2039 has been utilised for the analysis;
2. Performance Measure and Level of Service Method have been set to Degree of Saturation, to better represent the operation of SCATS;
3. Left turn slip lanes have been adopted as follows:
 - a. Arterial/arterial intersections – all approaches
 - b. Arterial/connector intersections in employment/industrial areas – all approaches
 - c. Other arterial/connector intersections – no slip lanes.
4. Where left turn slip lanes have not been provided, separate left turn lanes have been included;
5. Diamond right turn phasing has been adopted for both the main road and side road, with fully controlled turns;
6. Heavy vehicle volumes have been adopted as follows:
 - a. 4% of arterial road through traffic volumes; and
 - b. 2% of local streets (including turns from the arterial road).
7. Pedestrian volumes have been adopted as follows:
 - a. 20 pedestrians per hour for intersections through industrial areas
 - b. 50 pedestrians per hour for intersections through standard residential areas
 - c. 100 pedestrians per hour adjacent to town centres, railway station, etc.
8. Cycle times adopted as:
 - a. 90 to 120 seconds on arterial road intersections; and
 - b. 60 to 90 seconds on local road intersections.
9. Pedestrian movements will operate every cycle during the peak periods.
10. Intergreen times have been assumed at 6 seconds, comprising 4 seconds of yellow and 2 seconds of all-red. Some variation in these times can be expected, although on average, 6 seconds of intergreen is considered appropriate.
11. Pedestrian walk and clearance times based on SCATS standards:
 - a. Walk time (Green) based on the minimum of the walk distance at 1.2m/s plus 2 seconds, or 8 seconds; where the walk distance for a divided carriageway is based on the width of the widest carriageway plus the median width plus 1m;
 - b. Clearance time (Flashing Red) based on the clearance distance at 1.5 m/s; where the clearance distance for a divided carriageway is based on the width of the widest carriageway;
 - c. Where no partially controlled movements are opposed to the pedestrian movement (i.e. the opposed right turn is fully controlled and a left turn slip lane is provided), clearance times may overlap into the intergreen time by 2 seconds (ensuring 4 seconds minimum 'don't walk' time).
12. Pedestrian movements every second cycle have been allowed for;
13. Peak hour traffic volumes based on 55% of the two hour peak calculated by the modelling provided, with no additional peak flow factor;

14. Bus priority typically only impacts on signal operation where a bus is provided with a 'head start' lantern, which delays through traffic on the main road for a few seconds. This only occurs when a bus does not pass through the intersection on the green phase. Given the expected frequency of buses, the uncertainty with regard to bus routes, and the limited impact on intersection operation, bus operations have not been included in the analysis;
15. Bicycles have not been included in the analysis;
16. Adopted speed limits:
 - a. 6-lane arterial – 80km/h
 - b. 4-lane arterial – 60km/h
 - c. Connector – 50km/h
 - d. Town Centre – 40km/h
17. The length of a short lane utilised in the SIDRA analysis is taken as the length of the straight section of the turn lane, plus half of the taper length. This is considered to be the effective turn lane length, as the first half of the taper is considered too narrow to accommodate a full vehicle width.
18. The length of deceleration/turn lanes has been adopted as the minimum of the:
 - a. Minimum required for deceleration (based on the posted speed limit);
 - i. $80\text{km/h} = 100\text{m} = 85\text{m}$ in SIDRA;
 - ii. $60\text{km/h} = 55\text{m} = 45\text{m}$ in SIDRA;
 - iii. $50\text{km/h} = 40\text{m} = 30\text{m}$ in SIDRA; and
 - iv. $40\text{km/h} = 25\text{m} = 20\text{m}$ in SIDRA.
 - b. Queue length of the turn movement; or
 - c. Length required to achieve suitable intersection operation.
19. Lane widths of 3.5m have been adopted for all lanes;
20. Median widths of 2.5m have been adopted for all approaches;
21. Arrival Type for the through movement on an approach changed to "4 – Favourable", where:
 - a. The approach is an arterial road;
 - b. There is an upstream signalised intersection within 1km of the approach; and
 - c. The approach is in the peak direction of flow.
22. The following targets have been adopted with regard to intersection operation:
 - a. Intersection Degree of Saturation below 0.9
 - b. Maximum 95th percentile queue lengths of less than 250m

4 Analysis Results

The operation of each intersection was analysed using SIDRA Intersection. This computer package, originally developed by the Australian Road Research Board, provides information about the capacity of an intersection in terms of a range of parameters, as described below:

Degree of Saturation (D.O.S.) is the ratio of the volume of traffic observed making a particular movement compared to the maximum capacity for that movement. Various values of degree of saturation and their rating are shown in Table 4-1.

Table 4-1 Rating of Degrees of Saturation

| D.O.S. | Rating |
|------------|-----------|
| Up to 0.6 | Excellent |
| 0.6 to 0.7 | Very Good |
| 0.7 to 0.8 | Good |
| 0.8 to 0.9 | Fair |
| 0.9 to 1.0 | Poor |
| Above 1.0 | Very Poor |

It is considered acceptable for some critical movements in an intersection to operate in the range of 0.9 to 1.0 during the high peak periods, reflecting actual conditions in a significant proportion of suburban signalised intersections.

The **95th Percentile (95%ile) Queue** represents the maximum queue length, in metres, that can be expected in 95% of observed queue lengths in the peak hour; and

Average Delay is the delay time, in seconds, which can be expected over all vehicles making a particular movement in the peak hour.

The results of the analysis are attached in Appendix A.

Thompsons Road, Clyde Creek and
Casey Fields South PSP
